SUMMARY

Final-year Computer Engineering student who has shipped two real products end to end, most recently a faculty-facing platform now used by 10 mentors and the HOD at my college. I move comfortably between requirements, documentation, and the people a product is actually built for. Looking for a Product or Program Management internship to keep building at that intersection.

EDUCATION

Bachelor of Engineering — Computer Engineering, Ramrao Institute of Technology

Minor — Artificial Intelligence

Expected Graduation: 2027 | **CGPA: 9.1/10**

PRODUCT & REAL-WORLD TECHNICAL PROJECTS

Pixn — AI Website & Inbound Lead Builder *Product Management Intern*

June 2026–July 2026

- Took an unshippable, abstract concept ("business OS") and narrowed it to one sellable version: prompt in, live website out, with a working leads/RSVP inbox. Kept the team on one task at a time so half-finished features didn't pile up.
- Worked with 2 engineers to swap an unreliable HTML-streaming approach for a structured JSON schema. Generation time dropped from 6+ minutes to about 41 seconds.
- Ran Lighthouse audits on staging pages and traced a slow mobile load time to blocking fonts. Load time went from 3.4s to 1.8s once that was fixed.
- Before calling anything done, I checked it live: a script confirmed leads were reaching the database on real preview URLs before sign-off.

Academic Records & Mentorship Platform *Product Manager & 4-Week Solo Sprint* | Deployed with 10 Faculty Mentors & HOD Builder

- Interviewed 10 faculty members across three roles (mentors, class counsellors, HOD). The existing process ran through Google Forms, spreadsheets, and WhatsApp; those conversations turned into a scoped MVP and a PRD, including NEP compliance requirements (2 required NPTEL certifications by Semester 6).
- Built and shipped the whole thing solo over 4 weeks: a student portal for marksheets and NPTEL proof, a roll-number search, and a directory the HOD could use to find students for research. Manual form circulation went away entirely.
- Designed a 4-tier database with PostgreSQL row-level security, so mentor records stayed private while class counsellors could still see what they needed.
- Set up an alert that flags students who haven't registered for NPTEL 7 days before the deadline, so there's time to fix it before it becomes a problem.
- Since it went live, lookup time for class counsellors dropped from 15–30 minutes to under 10 seconds, and mentors' weekly admin work dropped from 2–4 hours to under 15 minutes.

Stripe — Stability OS *Self-Directed Product Teardown & Prototype*

- Researched Stripe's most-reported merchant complaint (60–180 day payout holds, 25–35% reserves) from public reviews and forums, then designed and prototyped a proactive fix: a live risk score, pre-hold warnings, and an SLA-backed case tracker.
- Set target metrics (a 40% cut in surprise holds, a 25-point NPS lift) and a 90-day rollout plan, and wrote up real risks, like the scorecard being gamed, before proposing mitigations.

SKILLS

Product Management: Product Discovery, PRD Writing, Stakeholder Interviews, MVP Scoping, Feature Prioritization, Regulatory/Compliance Roadmapping

Program & Project Delivery: Agile/Scrum Execution, Sprint Planning, Milestone Tracking, Technical Risk Mitigation, Cross-Functional Alignment, SDLC Delivery

Technical & Data Stack: SQL, JSON Schema, Tableau, REST APIs, Spreadsheets (Google Sheets/Excel, Pivot Tables), Python

Certifications: CS50: Introduction to Programming with Python (Harvard) · AWS Academy Graduate — Cloud Foundations · NPTEL — Data Science for Engineers (Elite) · NPTEL — Design, Technology and Innovation (Elite)
